INTRODUCTION

When electricity was first generated it created a need for current transformers (CT) used to measure electricity. In this catalogue we will identify all our CT. Current transformers are used:

- To identify and separate individual circuit(s) for measuring / protecting equipment connected to high voltage lines.
- To help identify / prevent high current transmissions.
- To reduce short circuit currents down to permissible levels, in sensitive measuring and protection equipment.
- To produce proportional secondary signals (0-5 A / 4-20 mA) to cover a given primary range (0 - 10 000 A) which is then connected to the appropriate measuring / protection device.

NOTE: Experience has shown that through improper selection / installation of measurement / protection transformers it may create situations where the device may not operate properly as well as a compromise personnel safety during critical periods.

SELECTION

To correctly select the measurement transformer (measurement or protection) the following information must be verified:

The application for which it is intended (measurement or protection)

Features of the operating environment, or conditions of use (indoors or outdoors, maximum operating temperature, etc.)

The specification of the wire(s) that the CT will be installed around:

- Size of cables or buss bar
- Primary current range to include maximum and minimum current to be measured
- Percentage of overload, range and time (if applicable)
- System voltage (low, medium or high)
- Short circuit current
- System frequency

Specification of the measurement / protection device associated with the CT to include accuracy, nominal current, consumption, etc.

Distance between the transformer and the device, plus the cable diameter used to connect the CT to the device

THE POWER OF A TRANSFORMER

Important Note: In the transformer, the primary current has to generate (induce) the power required for the secondary side to transmit the secondary current to the measurement device. Induced power has to be equal to or greater than the losses in the line plus consumption of the measurement device itself.

Losses in the line, P_L :

This is the power lost, through heat, generated by the passage of current through the resistance R_L in the cables, in the transformer's secondary circuit.

Factors to be taken into account:

- Secondary current. $P_L = R_L \cdot I^2$
- Cable diameter. R_L is inversely proportional to the square of the diameter
- Cable length. R_L is proportional to the length of cabling (there and back)

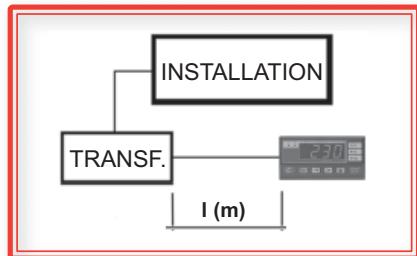

Power:

The nominal apparent power (V·A) with a specified power factor, which the current transformer supplies, to the secondary current with the assigned current when it is connected to its nominal load, $S_c (\text{V}\cdot\text{A}) = Z_c \cdot (I_{sn})^2$

According to Standards, for apparent power greater than or equal to 5 V·A, the power factor is 0.8 inductive. For apparent power less than 5 V·A the power factor is considered to be one (unity).

LOSSES IN A TRANSFORMER

Example:

Suppose a current transformer was connected to an ammeter 10 m away. What would be the loss at .../5A? What would be the loss at .../1A?

Data:

$$L_{\text{CABLE}} = 2 \cdot L = 2 \cdot 10 = 20 \text{ m}$$

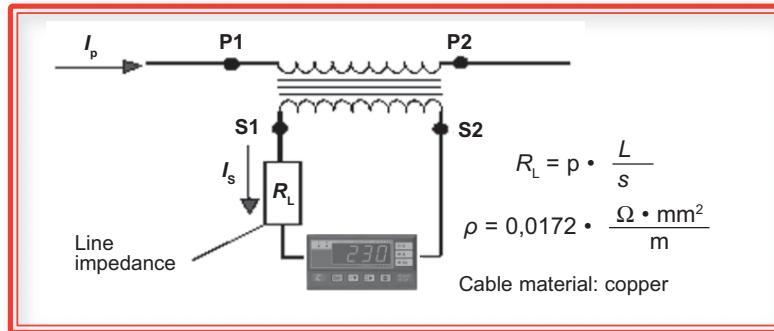

$$S_{\text{CABLE}} = 1 \text{ mm}^2$$

$$R_{\text{LINE}} = 0,0172 \cdot 20 / 1 = 0,35 \Omega$$

$$P_{\text{LINE}} = 0,35 \cdot 5^2 = 8,62 \text{ V}\cdot\text{A}$$

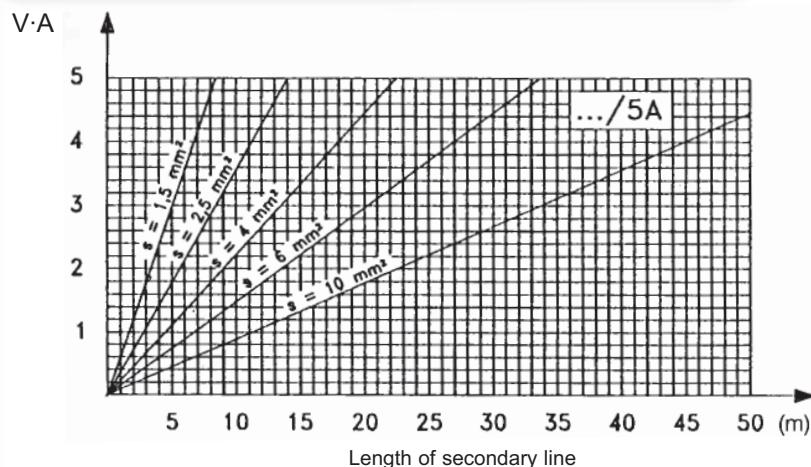

- If it was .../1 A

$$P_{\text{LINE}} = 0,35 \cdot 1^2 = 0,35 \text{ V}\cdot\text{A} \text{ (25 times less)}$$

EQUIPMENT	TYPICAL CONSUMPTION
Moving iron instruments	0,3 ... 15 V·A
Moving coil instruments	0,5 V·A
Analogue wattmeters	0,2 ... 2,5 V·A
Maximum Demand Indicators	2,5 ... 5,0 V·A
Digital instruments	0,5 ... 1,0 V·A
Energy meters	1,0 ... 1,5 V·A
Recording instruments	2,0 ... 5,0 V·A

TABLE OF LOSSES IN THE SECONDARY LINE

Note: With .../1 A transformers losses are reduced 25 times

ACCURACY OF A TRANSFORMER

The percentage of error, produced in a transformer, is established by IEC 44-1.

In measurement transformers: 25 % and 100 % of nominal power.

In protection transformers: 100 % of nominal power.

ERROR LIMITS. TABLE 1. ACCURACY CLASSES

TYPE	$\pm \%$ Error for $\% I_n$					Phase difference \pm for $\% I_n$							
					5	20	100	120	Minutes				Centiradians
	5	20	100	120					5	20	100	120	
0,1	0,40	0,20	0,10	0,10	15	8	5	5	0,45	0,24	0,15	0,15

FOR PROTECTION TRANSFORMERS

TYPE	$\pm \%$ Error for $\% I_n$	Phase difference \pm for $\% I_n$				Composite error
		Minutes		Centiradians		
5P	± 1	± 60		$\pm 1,8$		5
10P	± 3	---		---		10

THE TRANSFORMER WHEN SATURATED

A current transformer is saturated when the primary current, passing through the CT, is greater than the nominal rating of the CT.

The linearity of current transformation, between the primary and secondary sides decreases, so error increases. The saturation of the transformer is inversely proportional to the load (fig. 6).

The difference between measurement and protection current transformers is their behavior when an overload occurs on the primary side.

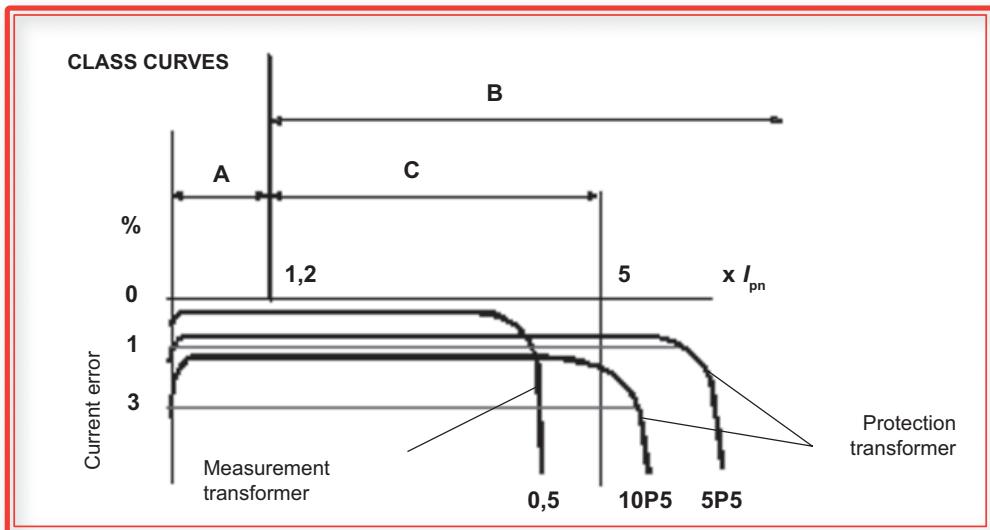

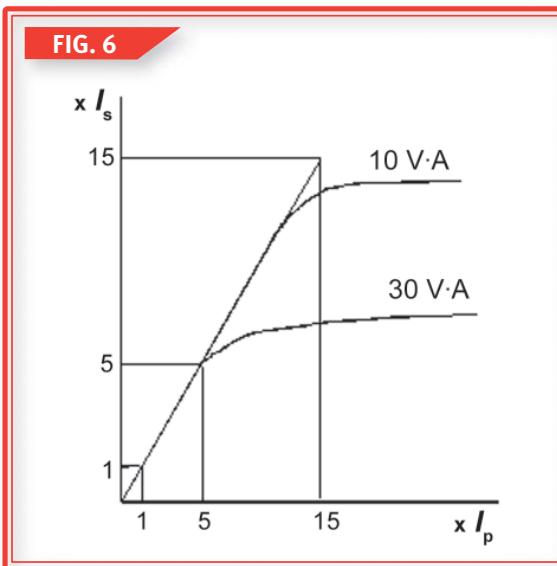

CT used for measurement are saturated when there is a primary current overload. In order to protect the equipment, on the secondary side, Protection transformers do not saturate until there is a very high current on the primary side.

A Class 5P15 protection transformer indicates that it has an accuracy rating of $\pm 1\%$ and that it does not become saturated until the primary current reaches 15 times the nominal current rating of the CT.

In measurement transformers, the SAFETY FACTOR "Fs" parameter indicates the excessive amperage on the primary side current in relation to the current sent to the measuring device on the secondary side.

* MULTI-RATIO TRANSFORMER:

Groups 6 current transformers into one single transformer. Ratio is selected according to the terminal connections on the secondary side.

FEATURES

	TM 45	TA 210	TW 25	TW 25 M
Frequency	50...60 Hz			
Assigned insulation voltage	3 kV			
Short-circuit thermal current, I_{th}	60 I_n			
Dynamic current, I_{dyn}	2,5 I_{th}			
Higher voltage for the material	0,72 kV			
Thermal class	A (105 °C)			
Encapsulated in self-extinguishing plastic	VO			
Safety factor	< 5			
Sealed secondary terminals	Yes			
Standards	IEC 44-1, UNE 21 088-1, UL 94, VDE 0414

TRM / TRMC / TRP

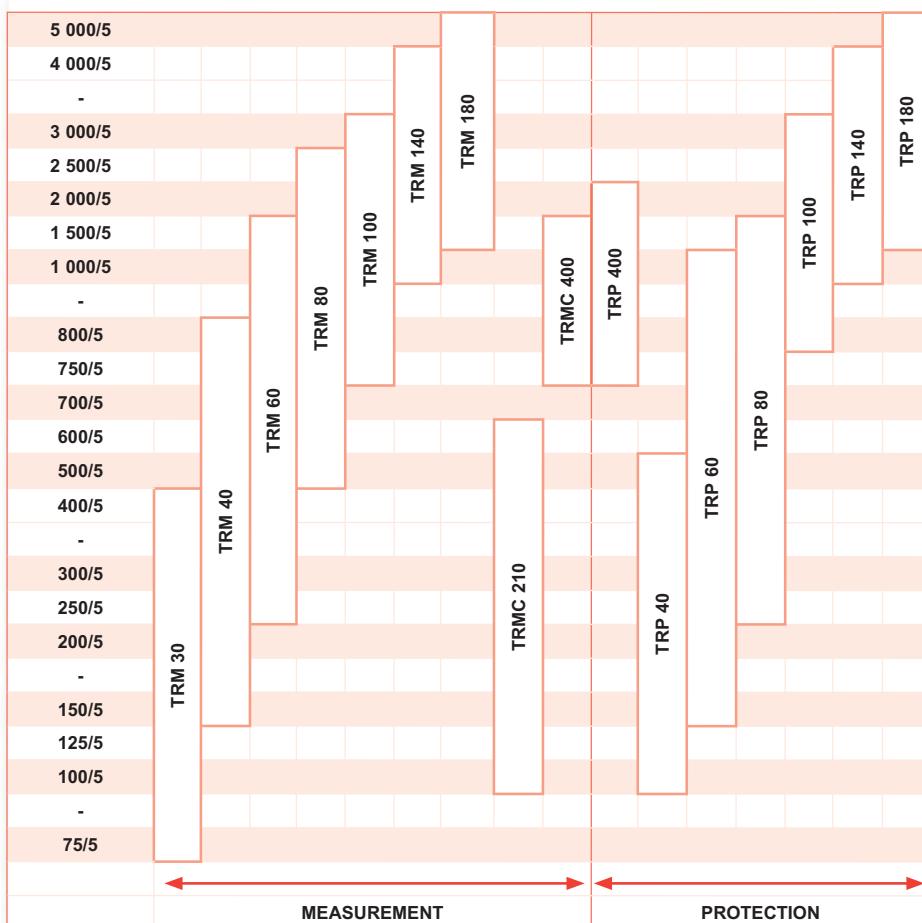

RESIN moulded transformers

CIRCUTOR has a large range of current transformers manufactured in resin. One of the advantages that this type of transformer has is that the resin increases the CT's strength relative to: mechanical resistance, high electrical rigidity, tropical weather, etc.). Also, the transformer core is not accessible in this Series.

There are 3 types of transformers: **TRM**, **TRP** and **TRMC**

- **TRM:** Transformers encapsulated in resin for measurement
- **TRP:** Transformers encapsulated in resin for protection
- **TRMC:** Transformers for utility company meters

Transformer selection table according to transformer ratio (I_{pn} / I_{sn})

TRM / TRP Series - Encapsulated in resin

(For further information see catalogue P.5)

SHUNTS

CIRCUTOR offers a wide range of Shunts up to 15,000 A for continuous current measurement. The standard secondary side output is 60 mV. 50, 100, 150, 200, 300, 600 mV outputs are available upon request.

Type	SH	
Ratio	A	
30 A / 60 mV	30	M71231

TSR

Having to add multiple sets of current transformers onto one measuring device is very common in meter installations. The **TSR** adding transformer offers an easy solution to this application. The output current generated by the **TSR** is obtained by using the following calculation:

$$I_{\text{OUTPUT}} = \frac{I_1 + I_2 + \dots + I_n}{n}$$

"n" is the number of inputs on the **TSR** and "I₁, I₂, ..., I_n" is the current of each input.

The **TSR** can add all the connected currents, from several sets current transformers, to generate a proportional output. To do this the ratio of connected CT has to be the same. Upon request a **TSR** can be manufactured to handle different ratio current transformers. Please specify ratios at time of inquiry.

Number of inputs	Power and accuracy	Type	Code
2 x 5 A	15 V-A / Class 0,5	TSR-2	M70701
3 x 5 A	15 V-A / Class 0,5	TSR-3	M70702
4 x 5 A	15 V-A / Class 0,5	TSR-4	M70703
5 x 5 A	15 V-A / Class 0,5	TSR-5	M70704

ACCESSORIES

TERMINAL COVER

Accessory to seal the secondary side terminals on the **TC** type transformer

Code: M79951

PA-TC / WG

Accessory to mount the **TC5**, **TC5.2**, **T6**, **TC6.2** transformer on a DIN rail

Code: P19921

FA-420

The **FA-420** module supplies a 15 V d.c. power supply. This module is fed with 230 V a.c.

Code: M79911
